# Getting the Oomnitza Connector

The Oomnitza Connector can be downloaded from within your Oomnitza instance. Log into your instance and navigate to the System Settings page by location the gear icon in the upper right-hand corner.

Scroll to the bottom of the Integrations page and download either the correct binary or the "Source Code" Package.

- If you will be hosting the connector on a Windows or Mac server, we recommend using the binary version.
- The Source Code package can be use on a Linux server, as well as Windows and Mac. This package requires that a python environment be setup properly, which the binary version avoids.

Once you have downloaded the version of the connector you will be using, extract the file to the location of your choice and proceed with the instructions in the README.pdf file.
